RO3003G2™ Circuit Materials

High Frequency Laminates

RO3003G2™ high-frequency ceramic-filled PTFE laminates are an extension of Rogers' industry leading RO3003™ solutions. RO3003G2 laminates are based on industry feedback to address the next generation needs for mm-wave automotive radar applications.

The combination of optimized resin and filler content along with the introduction of Very Low Profile ED copper translates to a Dk of 3.00 @ 10 GHz (clamped stripline method) & 3.07 @ 77 GHz (microstrip differential phase length method). These laminates also show very low insertion loss of 1.3dB/inch for 5 mil laminates as measured by the microstrip differential phase length method.

RO3003G2 laminates can be fabricated into printed circuit boards using standard PTFE circuit board processing techniques, with minor modifications as described in the application note "Fabrication Guidelines for RO3000® Series High Frequency Circuit Materials."

FEATURES AND BENEFITS:

Best in class performance for insertion loss
- Utilizing new Very Low Profile (VLP) ED copper

Minimize dielectric constant variation in finished PCB
- Homogeneous construction incorporating VLP ED copper and reduced dielectric porosity

Enable trend toward more small diameter vias
- Enhanced filler system using small rounded particles

Global manufacturing foot print
- Multiple high volume manufacturing plants

TYPICAL APPLICATIONS:

- Adaptive cruise control
- Forward collision warning
- Active brake assist
- Lane change assist
- Traffic jam pilot
- Parking pilot
- Blind spot detection

NOTES:
(1) Typical values are a representation of an average value for the population of the property. For specification values contact Rogers Corporation.
(2) The design Dk is an average number from several different tested lots of material and on the most common thicknesses. If more detailed information is required, please contact Rogers Corporation or refer to Rogers' technical papers in the Rogers Technology Support Hub at www.rogerscorp.com/techub
